FERMENTEN[®]
▲ REV UP THE RUMEN

Ruminal efficiency is our passion

When defining optimal food plans for growing heifers, the objective is for each ration to be tailored to each growth phase allowing them to reach maximum growth potential.

With this in mind, Granda Team's heifer growth program allows heifers to reach their full growth potential by targeting rapid rumen development and improved metabolizable protein production that consequently accompany such growth. It represents the best way for young cows to express their full genetic potential.

Applying specific rations of Fermenten to growing heifers optimizes bacterial protein production meaning that they grow more quickly and efficiently to reach their full potential.

Make heifers grow faster: feed them a diet that increases bacterial protein synthesis and consequently increases rumen efficiency

FERMENTEN is an effective source of peptides and nucleotides elements that are required for rapid and efficient proteinic synthesis of ruminal bacteria production.

FERMENTEN increases bacterial protein production.

FERMENTEN provides limiting amino acids that play a significant role in satisfying metabolizable protein requirements.

Achieving a situation which permits the moment of first insemination earlier than anticipated has important **ADVANTAGES**:

Anticipate calvings: Fermenten-fed heifers reach the point of first lactation several weeks earlier.

Longer productive life: first calving anticipation allowed a greater animal productive life, not leading to a greater risk of early exit.

Reduced farming costs The weeks in advance of calving have considerably reduced the costs of raising heifers, which can be estimated at around € 80-100 per month in advance

No negative effects have been noted in the case of premature delivery. Heifers who arrived early for the first calving demonstrated normal reproduction dynamics compared to animals that had not been fed with **Fermenten**.

Using **Fermenten** and the Granda Team heifers program makes it possible to anticipate milk production and increase the profitability generated by animals entering first lactation.

Heifer farming costs account for 10-15% of farms' total milk production expenses. Choosing to invest in Fermenten and the Granda Team heifer growth program allows you to significantly reduce the cost of farming young livestock!
